for CCTV solutions

www.oculuss.co.uk

Our Company's Mission

We deliver high value solutions to our customers through the implementation and maintenance of CCTV systems designed and installed to meet exactly our customers required outcomes in the most cost effective and environmentally friendly way.

CCTV surveillance systems are being deployed in ever increasing numbers across a wide range of applications. Oculus is one of the leading specialists in this growing and challenging field providing CCTV solutions to all of the main market sectors.

We achieved this position by:

Focusing on understanding our customers required outcomes.
 Developing and deploying the most appropriate technology to ensure that those outcomes are achieved in the most cost effective manner.
 Employing only staff who are experienced and share our commitment to fully satisfying our customers needs.
 Recognising our responsibilities to our staff and the environment and never to forget that we succeed only by continually satisfying our customers.

What we do:

We install, monitor and maintain CCTV systems throughout the UK. We employ the latest digital, wireless and internet linked technology to meet any customer needs, irrespective of power supply, access or coverage.
 This comprehensive capability enables us to respond within hours to any requirements, large or small, short or long term, planned or unplanned and to deliver maximum value to our customers.

We provide CCTV for:

Public Demonstrations, Sporting Events, Outdoor Events, Hotels, Supermarkets, Car Parks, Industrial / Commercial / Retail Properties, Road Works and ongoing systems support and maintenance where required.

PERMANENT INSTALLATIONS

The Installation of permanent CCTV systems now stretches across most aspects of every day life, from public and commercial properties, air, sea and rail parts, hospitals and hotels to sports stadia, vehicle parks, retailers, city centres and even to places we worship.

We offer all or any part of a turnkey service, which has a prime objective of ensuring that the installed system meets customer's performance needs in the most cost effective way and which can be maintained with the minimum of cost and disruption.

Our services include:

- Design or design reviews following detailed site assessments.
- Procurement, installation and commissioning of all equipment and materials.
- Maintenance and upgrading of the system over time.

Alternatively, we will act as an independent Project Manager on behalf of the customer, overseeing all aspects of the work. Our experience and capability extends from traditional single camera installations to multi remotely controlled fibre optic or wireless IP cameras fully networked or Internet linked.

Temporary Installations

More and more, CCTV services are being deployed on a temporary basis, where there is either a perceived short to medium term safety, security or commercial risk or to provide 'stop gap' cover pending the arrival of a permanent installation.

We have focused on the construction sector where it identified that a number of significant benefits would arise from the deployment of a CCTV systems both on new static sites and around the country on upgrading projects for the transport networks.

CCTV systems on these sites offer the following benefits over the traditional site security practices:

- a more effective deterrent than manned guards
- a much lower cost and reliable alternative to manned guards
- the elimination of health and safety issues for manned guards

- ready mobility about the site
- instantaneous and continuous surveillance at the touch of a button
- continuous recordings for subsequent investigations of incidents

And through Internet linking, members of the project management team have the added bonus of being able to monitor all aspects of site activity and progress, no matter where they might be at any one time.

As a 'stop gap' solution, with lead times becoming commonplace for the installation of strategically located permanent CCTV coverage, with our comprehensive capability we offer temporary, and very flexible systems to provide coverage, where and when the customer believes the critical needs to be, pending the arrival of the permanent installation.

Integrated System Services

In many security of safety situations, it is often necessary to incorporate different types of technology to provide the most effective solutions for customers. We have the capability and experience to enhance basic system performance by integrating them with existing or supplementary technologies.

As examples:

- Intruder Alarms normally form the basis of any security system for the most properties but are often ignored when activated. We will design and install such systems but recommend that they be integrated with simple CCTV coverage or where CCTV is to be installed, integrate it with the existing alarm system, to ensure that if activated, the reasons why can be seen clearly.

- Access Control and Intercom Systems are similarly enhanced by their integration with CCTV coverage and vice versa. We will install, retrofit and/or integrate these systems to cope with virtually any application which together provide significant added benefits to the customers.

- IT Integration and Broadband Supply offers the opportunity for off site and out of hours monitoring of the installed CCTV coverage, at any time and from anywhere in the world from a suitably enabled PC/Laptop. We ensure that our customers can exploit this capability if required, as all of our CCTV systems have this added functionality and the necessary PC connections. Where there are requirements to back up or circulate images to other users, our Microsoft accredited engineers will work with the customer's IT department to integrate the CCTV system into their own computer network.

Often in most of the above, where retrofitting is involved, an additional electrical supply is required. We can provide Part P accredited engineers and can provide ongoing PAT testing of the equipment to ensure Health and Safety obligations are met.

Service Support

We offer a range of service contract options to support our customers installed systems. These service contracts set out not only to maintain the original design effectiveness but also to provide for continuous improvement in capability through the latest market developments.
